

Real-time voltage management for energy savings.

The Harmonizer is an intelligent system for saving money on electricity. Utilities over supply voltage to overcome the universal challenges of supplying power over long distances with variable demand. The Harmonizer measures a building's incoming voltage, calculates the overage, and automatically throttles the supply down to a more optimum level.

If the grid supply fluctuates, the Harmonizer instantly reacts to ensure an optimum voltage level is maintained. If a major grid event occurs, the system switches to a bypass mode until the condition passes. By automatically throttling voltage in real-time, your building always gets exactly what it needs while saving as much power and money as possible.

Energy savings beyond voltage management.

The Harmonizer is more than just a voltage management device. It's a gateway to multiple energy efficiency and power quality technologies. Efficiency modules that improve different power problems can be added to the system incrementally to increase its energy saving performance.

The Harmonizer dashboard collects and presents a wide array of power data to make selecting additional modules easy. Once the system is installed in your electrical room, plug-and-play modules can be added cost-effectively and often times without the need for a power disruption to your building.
